

Bin Fen Green Wall System

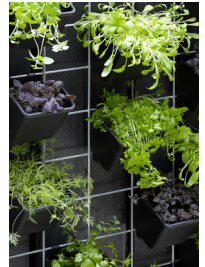

For living walls and vertical gardens

For living walls and vertical gardens

Bespoke

A metal lattice with a special mounting bracket is affixed to the wall that is to be used as a base. The plant pots in this system are specially finished and are fitted to the lattice by small hooks. Every pot is watered by means of drip irrigation and offers the plants enough room to grow. The pots can be easily removed from the wall by hooks and planted individually. New plants and an assortment of plant varieties can therefore be easily grown. In this way, the creativity of the landscape architects knows no limits!

Modular

The green wall is constructed out of several plastic frames. The frames (16cm X 80cm) have 5 openings to put plant pots into. Depending upon the desired amount of plants, several frames can be uniformly added together by means of an interlocking system. Various types of surface can be created through flexible connections. Special mountings affix these frames to outdoor and indoor walls. Drip irrigation ensures the most effective supply of water. Each plant pot can be individually planted and arranged, offering landscape architects a multitude of possible combinations with which to create an extraordinary experience for the client.
